Recently, mobile phone-based microscopy has emerged as a potential alternative to conventional microscopes for infectious disease diagnostics. Although less sensitive than an ELISA enzyme-linked immunosorbent assay this HRP2 concentration was within the relevant range for clinical diagnosis of malaria.

Consequently, selecting a scanning lateral flow strip reader for a particular diagnostic is to examine and optimize each individual component before integrating into a single diagnostic device. Additionally, innovations in hand-held optical readers discussed in section 5 require only simple adaptations to detect the anti-Stokes shift of UCP particles. Once collected, the dried blood spot samples were sent to district-level hospitals Level 2 which then sent the samples to a reference laboratory Level 3. The assay yielded a detection limit of 0. In LMICs, both urban and rural Level 1 facilities frequently lack essential resources such as consistent electricity and clean running water.
